

DEFINE. DESIGN. DELIVER.

PENTESEC SERVICES RISK AND COMPLIANCE TECHNOLOGY

Technology First means we only offer services we believe in and have mastered. We embed these services into our infrastructure, so our engineers have authentic experience using the solutions that we provide to you.

Risk Assessment and Visibility

Tenable offers a risk-based view of your entire attack surface—from IT to cloud to containers—so you can quickly identify, investigate and prioritize vulnerabilities.

Organisations are embracing new virtual and cloud assets such as containers. Mobile devices increasingly come and go from networks. Periodic scanning of traditional assets is no longer enough to deliver the necessary visibility and insight.

Managed in the cloud and powered by Nessus technology, Tenable.io provides the industry's most comprehensive vulnerability coverage with the ability to predict which security issues to remediate first. It is your complete end-to-end vulnerability management solution.

Breach and Attack Simulation

Picus Security is a breach and attack simulation platform that continuously assesses the "readiness level" of your business' security controls and relevant operations, using their proprietary threat and technique samples library - Picus Threat Library.

Picus assessments are vendor and platform agnostic and categorically safe. They can assess network, endpoint and email security controls in cloud, on-premise and in hybrid environments and, if Picus shows that a certain threat from the library has been missed, it means with a hundred percent certainty the security controls in the stack failed to detect and/or prevent the threat.

With customers across the globe ranging from financial, government energy, telecom, retail and manufacturing, Picus Security fills the gaps that pen-test, vulnerability management and policy management solutions cannot address.

Governance Risk and Control

Tufin enables organisations to automate their security policy visibility, risk management, provisioning and compliance across their multi-vendor, hybrid environment. Customers gain visibility and control across their network, ensure continuous compliance with security standards and embed security enforcement into workflows and development pipelines.

The Suite reduces the attack surface and meets the need for greater visibility into secure and reliable application connectivity. Its network security automation enables enterprises to implement changes in minutes with proactive risk analysis and continuous policy compliance.

Eliminate the security bottleneck and increase the business agility of your organization.
